Direct Vector Field Visualization

Direct or Elementary Methods

low level of abstraction

present all or most of the data

mapping is direct

no complex conversions

low cognitive effort

for reading local data

high cognitive effort

for understanding long-term behavior

very frequently used

color coding

arrow plots

Color Coding

extract scalar field

u, v, w-components, magnitude
loss of information

apply methods from scalar
field visualization

2D: color mapping

3D slices: color mapping

3D: isosurfaces, direct volume
rendering

Vertical Velocity Distribution. The baseline condition illustrates the flow pattern expressing the vertical velocity components over the range front-10 to 15 m/s. The baseline case with only a single elevation of overfire air produces a high velocity flow channel attached to the front wall with an associated recirculation down the rear wall of the main combustor section. The optimized case includes a revised overfire air configured to centralize the vertical flow region. The peak vertical velocities and size of the recirculation zones are reduced in the optimized case.

Volume Illustration for Flow Visualization

(a)

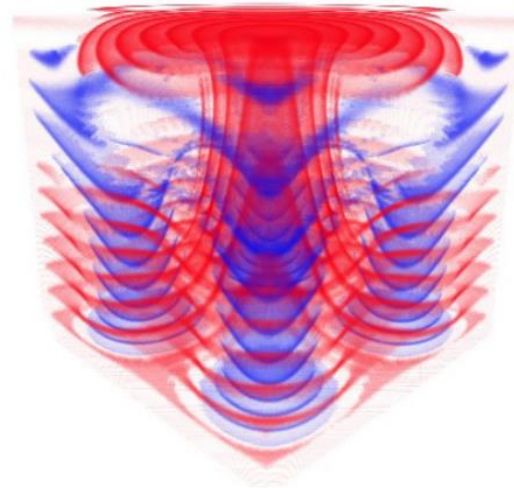

(b)

Figure 3: Volume illustrations of flow around the X38 spacecraft. (a) is an illustration of density flow and shock around the bow, while (b) highlights the vortices created above the fins of the spacecraft.

Volume Illustration

Use of two-dimensional transfer function with the Laplacian operator and other flow quantities. (a) shows heat inflow (red) and outflow (blue). (b) shows all values of the Laplacian of velocity magnitude in the tornado dataset. (c) visualizes the cloud TKE using the Laplacian to highlight boundaries (white) and velocity for silhouetting. (d) highlights emerging flow structures in the convection dataset using banding of the second derivative magnitude of the temperature field.

Arrow Plots

represent velocity as arrows at regular locations, e.g., place arrows at grid points

arrows: (scaled) unit length or encode magnitude

well-established for 2D

overloading possible

also called *hedgehog plots*

unit length arrows

Arrow Plots

represent velocity as arrows at regular locations, e.g., place arrows at grid points

arrows: (scaled) unit length or encode magnitude

well-established for 2D

overloading possible

also called *hedgehog plots*

original length arrows

Arrow Plots in 3D

occlusion problem

careful seeding

ambiguity problem

depth perception

better perception

3D icons (cylinder + cone)

3D Arrow Plots and Color Coding on Slices

Figure 8: Freely movable slicing probe, using texture hardware to visualize the shape of a vortex.

[Kirby et al 99]: show multiple variables of 2D flow data using a layering concept related to painting process of artists

Figure 1: Typical visualization methods for 2D flow past a cylinder at Reynolds number 100. On the left, we show only the velocity field. On the right, we simultaneously show velocity and vorticity. Vorticity represents the rotational component of the flow. Clockwise vorticity is blue, counterclockwise yellow.

Reynolds number 100

simulated flow

Reynolds number 500

experimental flow

KEY	
data	visualization
velocity	arrow direction
speed	arrow area
vorticity	underpainting/ellipse color (blue=cw, yellow=ccw), and ellipse texture contrast
rate of strain	$\log(\text{ellipse radii})$
divergence	ellipse area
shear	ellipse eccentricity

Summary

- low level of abstraction
- present all or most of the data
- Color Coding
 - scalar field visualization for specific aspects of the vector field
 - loss of information
- Arrow Plots
 - show vector as (scaled) arrow
 - very common in 2D or on 3D slices
 - perceptual issues, especially in 3D
- Combined methods
